Annoucements

Important admin

- 1. Congratulations on clearing your Midterm exams!
 - 1. When Midterm results? Please be patient; Rizki/Chonghui is marking the scripts.
 - 2. When released any issues also go to them.
- 2. Last tutorial no [@] Questions, this week will have 4 [@] questions!

Question 1 [G]

Decide whether a bunny is ready to be released into the wild based on two features: **Feature A** is a bunny's cuteness score and **Feature B** is a bunny's fluffiness score.

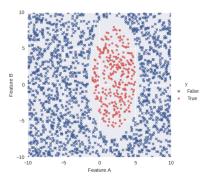

Figure 1: Feature A/B; Ready to be released into the wild?

- a. Which min set of features that will perfectly (linearly) classify?
- b. After changing production methods, samples are collected below; min features?
- c. [@] How can we always find a *min* set of features, how does it relate to kernels?

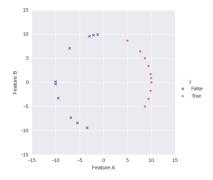

Figure 2: New Production Method.

Recap

• What is linear separability, why is it desriable?

• How to achieve linear separability?

Answer 1a

Notice that an ellipse with major and minor axis parallel to y-axis and x-axis is sufficient to classify the data. Hence,

• (A^2, B^2, A, B) minimally suffices.

For more general ellipses (or conics) you can use the more general set of features:

• (A^2, AB, B^2, A, B) .

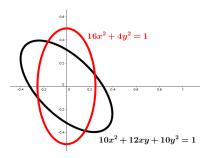

Figure 3: Centered Ellipse; If axis-parallel AB is not needed. If centered, A, B is not needed.

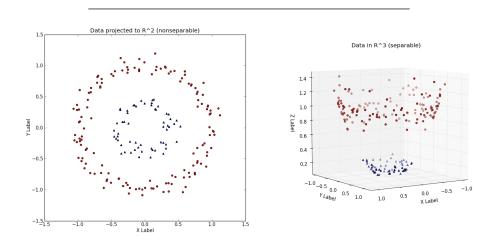

Figure 4: Linear Separability

Answer 1b

We can use just use A.

Question 2 [G]

Logistic Regression model which has the following hypothesis, where, $h_w(x)$ could be interpreted as a probability p assigned by the model such that y = 1. The probability of y = 0 is therefore 1 - p.

$$h_w(x) = \frac{1}{1+e^{-w^Tx}}$$

- a. Calculate the derivative of $\log(p)$ with respect to each weight w_i .
- b. Calculate the derivative of $\log(1-p)$ with respect to each weight w_i .
- c. Derive $\frac{\partial L}{\partial w_i}$, where L is the loss function of logistic regression model.

Recap

- What is logistic regression?
 - What is logistic? what is regression?

Answer 2a

First we write the probabilty p as a function of x. $p = \frac{1}{1+e^{-w^Tx}} = \frac{1}{1+e^{-w\cdot x}} = \frac{1}{1+e^{\sum_{i=1}^{n} - w_i x_i}}$

Take the log of both sides,

$$\log(p) = \log\left(\frac{1}{1 + e^{\sum_{i=1}^{n} - w_i x_i}}\right) = -\log(1 + e^{\sum_{i=1}^{n} - w_i x_i})$$

Now we differentiate $\log(p)$ with respect to w_i

$$\begin{split} \frac{\partial \log(p)}{\partial w_i} &= -\left(\frac{1}{1+e^{\sum_{i=1}^n - w_i x_i}} \frac{\partial}{\partial w_i} (1+e^{\sum_{i=1}^n - w_i x_i})\right) \\ &= -p \frac{\partial}{\partial w_i} (1+e^{\sum_{i=1}^n - w_i x_i}) \\ &= -p(-x_i)e^{\sum_{i=1}^n - w_i x_i} \\ &= (1-p)x_i \end{split}$$

Answer 2b

First we write the probabilty 1-p as a function of x. $1-p=1-\frac{1}{1+e^{-w^Tx}}=\frac{e^{-w^Tx}}{1+e^{-w^Tx}}=\frac{1}{1+e^{w^Tx}$

Take the log of both sides,

$$\log(1-p) = \log\left(\frac{1}{1+e^{\sum_{i=1}^n w_i x_i}}\right) = -\log(1+e^{\sum_{i=1}^n w_i x_i})$$

Now we differentiate $\log(1-p)$ with respect to w_i

$$\begin{split} \frac{\partial \log(1-p)}{\partial w_i} &= -\left(\frac{1}{1+e^{\sum_{i=1}^n w_i x_i}} \frac{\partial}{\partial w_i} (1+e^{\sum_{i=1}^n w_i x_i})\right) \\ &= -(1-p) \frac{\partial}{\partial w_i} (1+e^{\sum_{i=1}^n w_i x_i}) \\ &= -(1-p)(x_i) e^{\sum_{i=1}^n w_i x_i} \\ &= -(1-p)(x_i) \left(\frac{p}{1-p}\right) = -p x_i \end{split}$$

Answer 2c

$$L=-y\log(h_w(x))-(1-y)\log(1-h_w(x))$$

First we substitute $h_w(x)$ as p:

$$L = -y \log(p) - (1 - y) \log(1 - p)$$

Now we differentiate L with respect to w_i :

$$\begin{split} \frac{\partial L}{\partial w_i} &= -y \frac{\partial \log(p)}{\partial w_i} - (1-y) \frac{\partial \log(1-p)}{\partial w_i} \\ &= -y (1-p) x_i - (1-y) (-p x_i) \\ &= -x_i (y-p) \\ &= x_i (h_w(x)-y) \end{split}$$

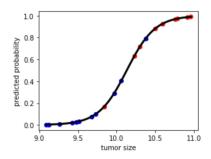

Figure 5: Model probability output and tumor size

Question 3

Model M outputs 1 if M(x) is greater than or equal to the threshold p, otherwise 0.

- a. For the threshold p = 0.5, come up with the confusion matrix.
- b. For the threshold p = 0.5, find the precision, recall and F1 score.
- c. Based on the figure, derive the ROC curve.

Answer 3a

	Prediction 0	Prediction 1
Actual 0	10	1
Actual 1	1	8

Answer 3b

$$\begin{split} Precision &= \frac{TP}{TP + FP} = \frac{8}{8+1} = \frac{8}{9}, Recall = \frac{TP}{TP + FN} = \frac{8}{8+1} = \frac{8}{9} \\ F1 &= \frac{2*TP}{2*TP + FP + FN} = \frac{2*8}{2*8+1+1} = \frac{8}{9} \end{split}$$

Answer 3c

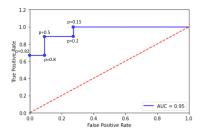

Figure 6: ROC curve

Question 3d-f [G]

- d. [@] Based on the ROC curve you derived, decide which threshold you want to choose among p = 0.2, p = 0.5 and p = 0.8.
- e. [@] When to maximize precision or recall? What does it mean?
 - Detecting tumours / Detect plagiarism / PS5 Credit Card Fraud

Maximize precision / recall = Minimize FP / FN = Minimize Type 1 / Type 2 Error.

- Type 2 error Missing diagnosis of tumor when actually tumor
- Type 1 error Wrongly diagnosis of tumor when no tumor

If regular check up > Min start treatment on healthy > Min Type 1 > Max Precision

If monitoring > Min stop cancer treatment on sick > Min Type 2 > Max Recall

Question 4

Logistic Regression for Multi-Class Classification:

$$W = \left(\begin{array}{c} w_{cat} \\ w_{horse} \\ w_{elephant} \end{array} \right) = \left(\begin{array}{ccc} 4.2 & -0.01 & -0.12 \\ -20 & -0.08 & 35 \\ -1250 & 0.82 & 0.9 \end{array} \right), \quad X = \left(\begin{array}{ccc} 1 & 4.2 & 0.4 \\ 1 & 720 & 2.4 \\ 1 & 2350 & 5.5 \end{array} \right)$$

- a. Compute the probability of an animal belonging to a certain class and classify them.
- b. What if we want to extend the classification task to classify other animals? Can we train a new model while keeping the weights of the previous models?

Recap

- 1. What is the equation for Logistic Regression?
- 2. How can we compute this efficiently?

Answer 4a

$$-X\times W^T = \left(\begin{array}{cccc} -4.1100 & 6.3360 & 1246.1960 \\ 3.2880 & -6.4000 & 657.4400 \\ 19.9600 & 15.5000 & -681.9500 \end{array} \right), \quad P = \left(\begin{array}{ccccc} 0.9839 & 0.0018 & 0.0000 \\ 0.0360 & 0.9983 & 0.0000 \\ 0.0000 & 0.0000 & 1.0000 \end{array} \right)$$

$$Y = \begin{pmatrix} cat \\ horse \\ elephant \end{pmatrix}$$

Answer 4b

If the new class has distinct features then yes. Otherwise no. However, the model may still benefit from retraining.

Question 5 [G]

Which of the following evaluation metrics is the **least** appropriate when comparing a logistic regression model's output with the target label?

- a. Accuracy
- b. Binary Cross Entropy Loss
- c. Mean Squared Error
- d. AUC-ROC
- e. Mean Absolute Error

[@] What is the difference between evaluation metrics vs cost functions / loss? Which would be the best for LR loss?

Recap

- 1. Which methods are primarily used for classification?
- 2. What are some of the key limitations of each method?

Answer 5

Metrics	Type	Formula
Accuracy Binary Cross Entropy Mean Squared Error Mean Absolute Error AUC-ROC	Class Class Loss Reg. Loss Reg. Loss Class	$\frac{\frac{TP+TN}{TP+FP+FN+TN}}{-y\log(h_w(x))-(1-y)\log(1-h_w(x))}$ $\frac{\frac{1}{2}(y-h_w(x))^2}{\frac{1}{2}(y-h_w(x))}$ Area under a ROC curve

Abuse: M1 is better than M2 $y=[0,0,1], \hat{y}_1=[0.2,0.4,0.6], \hat{y}_2=[0.1,0.6,0.9],$ but

	MSE	MAE	BCE
M1 M2	$0.08 \\ 0.063$	0.20 0.133	0.511 0.376

Depends on the task / objective (performance/model uncertainty) and context:

- Accuracy:
 - Dataset must be close to being uniform to be meaningful
- Binary Cross Entropy Loss:
 - Suffers from problem with being objective performance measure
 - Maybe appropriate if objective is model uncertainty comparing within LR classes
 - Designed for loss, popular and has properties to rely on:
 - * Measure difference in 2 probability distribution
- MAE/MSE:
 - Suffers from problem with being objective performance measure
 - Designed for regression, essentially distance measures
- AUC-ROC:
 - Usually the most robust
 - More complicated to calculate

Bonus Qn

To help you further your understanding, not compulsory; Work for Snack/EXP!

Tasks

- 1. Implement code to solve Q3,4,5, no boilerplate code given.
 - 1. Calculation for Q3a,b precision and recall.
 - 2. Calculation for Q4a using numpy matrices
 - 3. Calculation for the Q5 illustration between MSE/MAE/BCE

Buddy Attendance Taking

- 1. [@] and Bonus declaration is to be done here; You should show bonus to Eric.
- 2. Attempted tutorial should come with proof (sketches, workings etc...)
- 3. Guest students must inform Eric and also register the attendance.

Figure~8:~Buddy~Attendance:~https://forms.gle/jsGfFyfo9PTgWxib6
